DATA VISUALIZATION

# INTRODUCTION

**1.**

In the past several years, AI has shifted from an emerging technology to an advanced mainstream tool reshaping the job market for computer science professionals. For us, as senior computer science students, we're on the verge of entering this market, and the implications of that shift are what we'll be facing after graduation. This project is exploring the CS job market and how AI serves as a potential threat to future job opportunities. The data we sourced are from the U.S. Bureau of Labor Statistics, Kaggle, and Mendeley Data. These data hold value that helps us analyze factors such as adoption of AI, automation risks across industries, trends for wages and compensation, and geographical distribution of the tech industry. Our goal is to present what AI imposes upon current and upcoming computer scientists.

**2.**

## DATA SOURCES

- Kaggle: Occupation, Salary and Likelihood of Automation
- U.S. Bureau of Labor Statistics
- Mendeley Data: Global AI Adoption Trends by Industry Sector, Country, and Business Function (2017–2025): A Compiled Research Dataset

AI  
BOOM

# A.I. Surges Across All Industries (2022 vs 2025)

Every sector massively adopted AI with Government and Education seeing the largest relative gains.

### Highest Automation Risk

Clerical, repetitive, and rule-based roles face near-certain automation.

### Lowest Automation Risk

Roles requiring empathy and clinical judgment expertise remain highly resistant.

# OTHER SIDE OF THE BOOM

# AI Adoption Over Time (2017-2025)

AI Adoption steadily increases from 2017-2025, with the sharpest increase seen in 2022-2025 (from 50% up to 88%).

# Unemployment Rate for Computer Science-Related Graduates (2017–2025)

Unemployment remains at around the 3-4% level from 2017-2019, then spikes in the 2020s, with large spikes to 4.9% in 2021 and 5.9% in 2025.

# CONCLUSION

- **Geographical:** Washington and California offer the strongest job prospects based on company presence and salaries.
- **Threats by AI:** Given a recent surge in AI Adoption rate, research show that jobs that are repetitive and clerical face the highest risk of automation by AI
- **Compensation/Wage Trend for employment:** Current wage trends reveal a significant gap in 'hidden' compensation, particularly regarding employer-provided benefits
- **AI Adoption Increase vs Unemployment:** Too early to conclude that AI will take over Computer Science related occupations, but raises questions about the direction of the job market is headed in
